

Regolatori idraulici di velocità – Serie 35 e Serie 40

Hydraulic speed regulators – 35 and 40 series

DESCRIZIONE

Costruzione a tiranti con serbatoio di compensazione in linea o in parallelo.

Il regolatore di velocità è un circuito idraulico chiuso, privo di una propria sorgente di potenza. Consiste praticamente di un cilindro riempito di olio, uno stelo con relativo pistone, una valvola di regolazione e un serbatoio di compensazione. Quando lo stelo del regolatore viene accoppiato ad un organo esterno in movimento il pistone del regolatore stesso si muove chiudendo la valvola unidirezionale interna quindi forzando l'olio attraverso il tubo di trasferimento verso la valvola di regolazione dove trova una restrizione variabile dall'esterno che ne determina la velocità. Dopo la valvola di regolazione l'olio fluisce nell'altra camera, separata tramite il pistone. Durante il movimento di ritorno la valvola unidirezionale si apre e l'olio fluisce senza ostacoli permettendo un rapido movimento di ritorno. Il serbatoio posto in linea o in parallelo ha la funzione di compensare la fuoriuscita e il livello dello stelo e compensare minimi trafileamenti. L'astina del serbatoio determina il livello d'olio. Su richiesta è possibile corredare questi regolatori di velocità con valvole di controllo: **valvole di accelerazione (SKIP)** **valvole di arresto (STOP)**, **valvole di accelerazione e di arresto combinate (SKIP+STOP)**. Queste valvole sono normalmente aperte e vengono comandate ad aria. Così modificati i regolatori di velocità possono arrestare e/o accelerare la velocità prestabilita da un volantino regolabile dall'esterno.

APPLICAZIONI

Il regolatore idraulico di velocità viene normalmente accoppiato ad un cilindro pneumatico onde ottenere una velocità cosante del movimento.

VELOCITA'

La velocità è regolabile.

Le variazioni della temperatura provocano modifiche di viscosità dell'olio e quindi piccole variazioni di velocità.

CARATTERISTICHE COSTRUTTIVE

- Alesaggio.....Diametro 35-40mm
- Testate.....Alluminio ossidato nero
- Stelo.....Acciaio C45 cromato
- Camicia.....Acciaio trafileato lucido
- Tiranti.....Acciaio zincato

- Pistone.....Alluminio
- Guarnizioni.....NBR e poliuretano
- Valvole skip/stop.....Alluminio ossidato nero
- Olio.....Idraulico, classe H simbolo ISO HG 46, viscosità 4,5 E. a 40° C

CARATTERISTICHE TECNICHE

-Carico max controllabile

Serie 35.....Senza valvole 400 Kgf.

Con valvole 300 Kgf. (comprese inerzie di masse in movimento)

Serie 40.....Senza valvole 600Kgf

Con valvole 500 Kgf. (comprese inerzie di masse in movimento)

-Velocità min e max.....Senza valvole 70 – 10000 mm./min.

Con valvole 0 – 6000 mm./min.

-Temperatura di esercizio....-10°C / +60°C

-Press. azionamento valvole

Skip/Stop.....4 – 8 bar

DESCRIPTION

Tie rod construction with in-line or in-parallel compensation tank.

The speed regulator is basically a closed hydraulic circuit without its own power source. It consists of a cylinder filled with oil, a piston rod and piston, a control valve and a compensation tank. When the regulator rod couples with an external moving organ, the piston rod moves to close the one-way valve inside, which forces the oil through the transfer pipe towards the control valve, where it encounters a restriction that can be adjusted externally to determine the speed. The oil flows through the control valve into the other chamber which is separated by the piston. During return movement, the one-way valve opens and the oil flows freely to enable a rapid return movement. The in-line or in-parallel tank compensates the rod movement and minimum blow-by. The dip-stick in the tank can be used to determine the oil level. These speed regulators can be fitted with control valves as follows acceleration valves (SKIP), stop valves (STOP), acceleration + stop valve combinations (SKIP + STOP). These valves are normally opened and controlled by air. Modified in this way, speed regulators can stop and/or accelerate the speed set by an externally adjustable hand-wheel.

APPLICATION

The hydraulic speed regulator is normally coupled with a pneumatic cylinder to get a constant speed.

SPEED

The speed can be regulated

Temperature variations alter the viscosity of the oil hence slightly affect the speed.

CONSTRUCTIVE CHARACTERISTICS

- Bore 35 mm and 40 mm diameter
- Heads Oxidized aluminium
- Piston Rod C45 chromium plated steel
- Chamber Drowned and polished steel
- Tie rods Galvanized steel

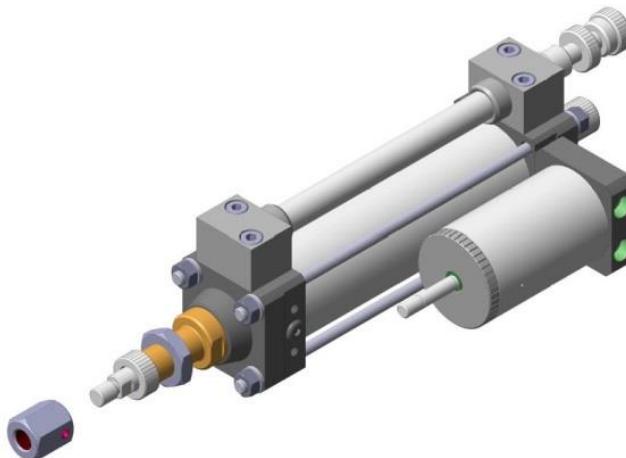

- Piston Aluminium
- Gaskets NBR and polyurethane
- Skip/Stop Valves Black oxidized aluminium
- Oil Hydraulic, H class ISO symbol HG 46. 4,5 E. viscosity at 40°C

TECHNICAL CHARACTERISTICS

- Maximum adjustable force
Series 35 without valves: 400 kgf.
with valves: 300 kgf. (including any inertia developed by moving masses)
- Series 40 without valves: 600 kgf.
with valves: 500 kgf. (including any inertia developed by moving masses)

- Min. and max. speed without valves: 70 – 10.000 mm./min
with valves: 0 – 6.000 mm./min.
- Working temperature – 10°C / +60°C
- Pressure to act
Skip –Stop valves 4 - 8 bar
